

**Periodicities in the Daily Proton Fluxes from 2011 to 2019  
measured by the Alpha Magnetic Spectrometer on the  
International Space Station from 1 to 100 GV  
- SUPPLEMENTAL MATERIAL -**

(AMS Collaboration)

In the following tables we present the daily proton flux  $\Phi_p$  as a function of rigidity at the top of AMS. The fluxes are in units of  $[\text{m}^2 \cdot \text{sr} \cdot \text{s} \cdot \text{GV}]^{-1}$ . The errors include statistics ( $\sigma_{\text{stat.}}$ ), time-dependent systematic errors ( $\sigma_{\text{time}}$ ) and the total systematic error ( $\sigma_{\text{syst.}}$ ). Contributions to the time-dependent systematic errors ( $\sigma_{\text{time}}$ ) are from: the trigger efficiency and the reconstruction efficiencies. Contributions to the total systematic error ( $\sigma_{\text{syst.}}$ ) are from: the time-dependent systematic error, the background evaluation, the geomagnetic cutoff, the acceptance calculation, the rigidity resolution function, and the absolute rigidity scale.

The days are defined as UTC time 00:00:00 – 23:59:59. The daily collection time of the proton fluxes is  $(1.6 - 3.7) \times 10^3$  s at 1 GV,  $(4.5 - 7.5) \times 10^3$  s at 2 GV,  $(1.8 - 2.3) \times 10^4$  s at 5 GV,  $(3.3 - 3.8) \times 10^4$  s at 10 GV,  $(6.1 - 7.0) \times 10^4$  s at 20 GV, and, above 30 GV, reaches  $(6.7 - 7.3) \times 10^4$  s out of  $8.64 \times 10^4$  s per day.
